

## “LCG2 Operational Experience and Status”

Markus Schulz, IT-GD, CERN  
markus.schulz@cern.ch

EGEE is a project funded by the European Union under contract IST-2003-508833

## Outline

- Why LCG ???
- Building LCG-2
- Operating LCG
  - releases
  - changes for gLite
- Impact of Data Challenges on operations
- Problems
- Changes
  - operations
- Summary

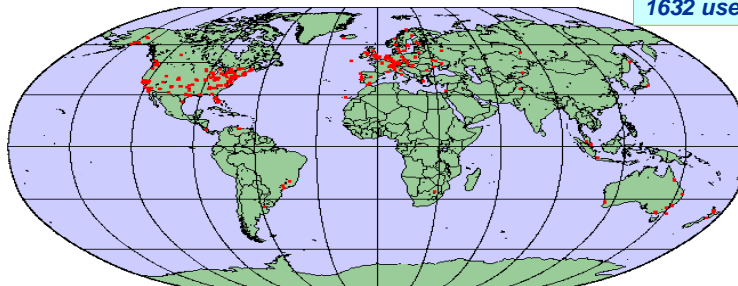

- LHC (Large Hadron Collider)
  - with 27 km of magnets the largest superconducting installation
  - proton beams collide at an energy of 14TeV
  - 40 million events per second from each of the 4 experiments
  - after triggers and filters 100-1000MBytes/second remain
  - every year ~15PetaByte of data will be recorded
  - this data has to be reconstructed and analyzed by the users
  - in addition large computational effort to produce Monte Carlo data
  - O(100K) of current CPUs are needed for processing the data

- Collaborators
  - > 6000 users from 450 institutes

Europe:  
267 institutes  
4603 users

Elsewhere:  
208 institutes  
1632 users

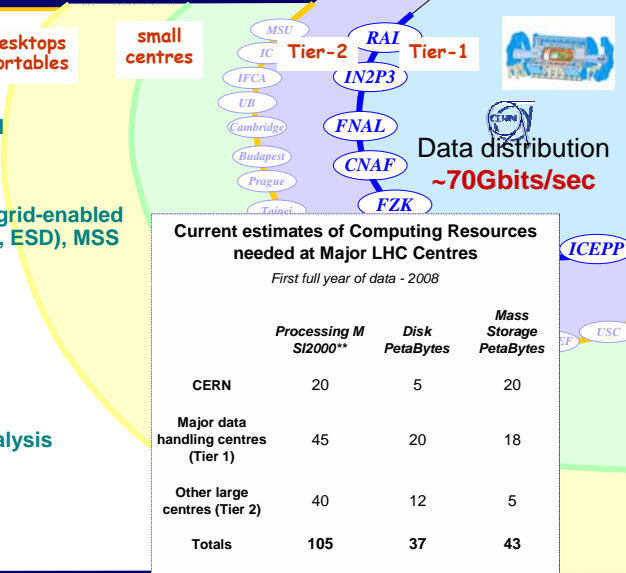

Enabling Grids for  
E-science in Europe

## LCG Scale and Computing Model

- Tier-0
  - reconstruct (ESD)
  - record raw and ESD
  - distribute data to tier-1
- Tier-1
  - data heavy analysis
  - permanent, managed grid-enabled storage (raw, analysis, ESD), MSS
  - reprocessing
  - regional support
- Tier-2
  - managed disk storage
  - simulation
  - end user analysis
  - parallel interactive analysis

Data distribution  
~70Gbits/sec

**Current estimates of Computing Resources needed at Major LHC Centres**  
First full year of data - 2008

	Processing M SI2000**	Disk PetaBytes	Mass Storage PetaBytes
CERN	20	5	20
Major data handling centres (Tier 1)	45	20	18
Other large centres (Tier 2)	40	12	5
<b>Totals</b>	<b>105</b>	<b>37</b>	<b>43</b>

\*\* Current fast processor ~1K SI2000

Enabling Grids for  
E-science in Europe

## LCG-2 software

- **Evolution through 2003/2004**
  - Focus has been on making these reliable and robust
    - Basic functionality and reliability rather than additional functionality
  - Respond to needs of users, admins, operators
- **The software stack is the following:**
  - Virtual Data Toolkit
    - Globus (2.4.x), Condor, etc
  - EDG developed higher-level components
    - Workload management (RB, L&B, etc)
    - Replica Location Service (single central catalog), replica management tools
    - R-GMA as accounting and monitoring framework
    - VOMS being deployed now
  - Operations team re-worked components:
    - Information system: MDS GRIS/GIIS → BDI
    - edg-rm tools replaced and augmented as lcg-utils
    - Developments on:
      - Disk pool managers (dCache, DPM)
      - Catalogue
  - Other tools as required:
    - e.g. GridIce - DataTag

• Maintenance agreements with:

- VDT team (inc Globus support)
- WLM, VOMS – Italy
- DM – CERN

DESY Seminar
CERN IT-GD
Jan 2005
6

Enabling Grids for  
E-science in Europe

## Experience

- Jan 2003 GDB agreed to take VDT and EDG components
- September 2003 LCG-1
  - **Extensive certification process**
  - **Integrated 32 sites ~300 CPUs** first use for production
- December 2003 LCG-2
  - **Deployed in January to 8 core sites**
  - **Introduced a pre-production service for the experiments**
  - **Alternative packaging (tool based and **generic** installation guides)**
- Mai 2004 -> now monthly incremental releases (not all distributed)
  - **Driven by the experiences from the data challenges**
  - **Balance between stable operation and improved versions (driven by users)**
  - **2-1-0, 2-1-1, 2-2-0, 2-3-0, (2-4-0)**
  - **(Production services RBs + BDIs patched on demand)**
  - **> 110 sites (3-5 failed)**

DESY Seminar
CERN IT-GD

7

Enabling Grids for  
E-science in Europe

## Adding Sites

failed 3-5 times

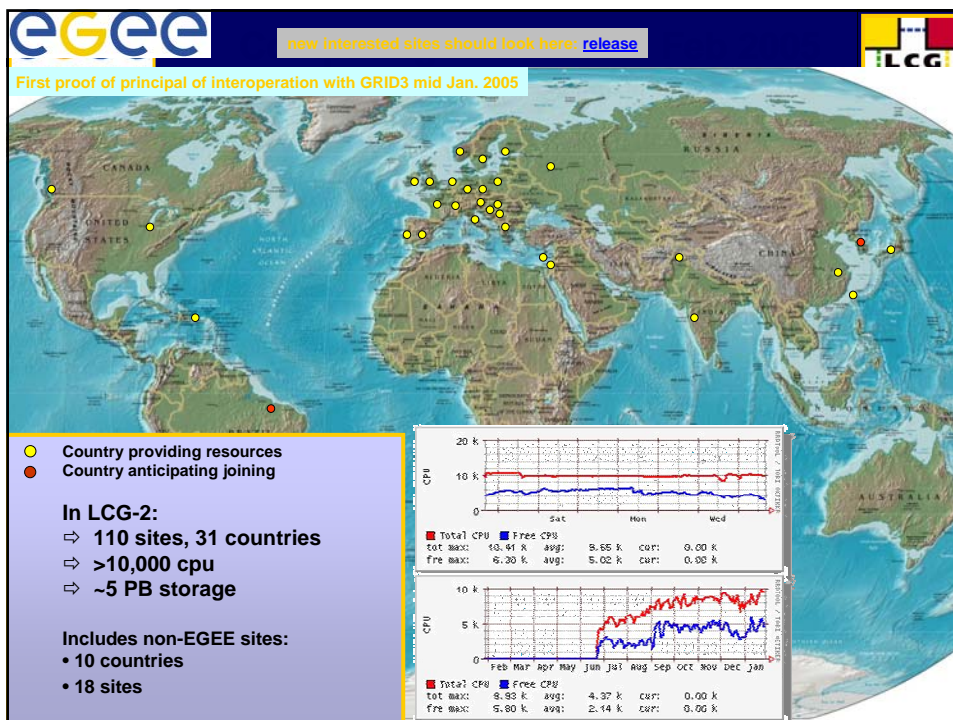

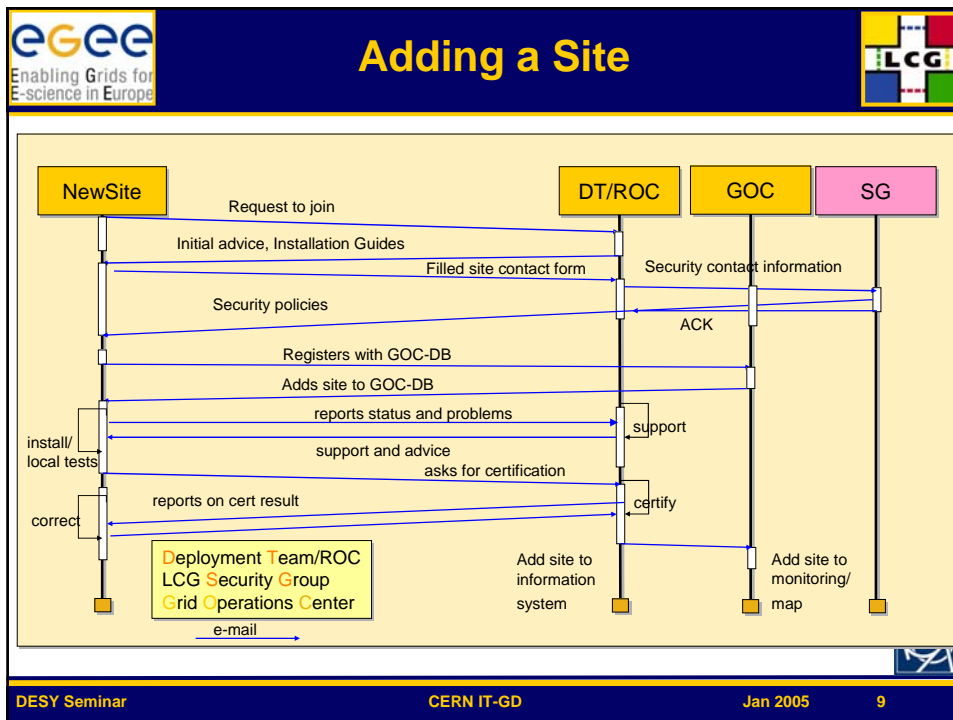

- ... Group **or** Regional Operation Center (ROC)
- Site [page](#)
- Sites ... tool based installation

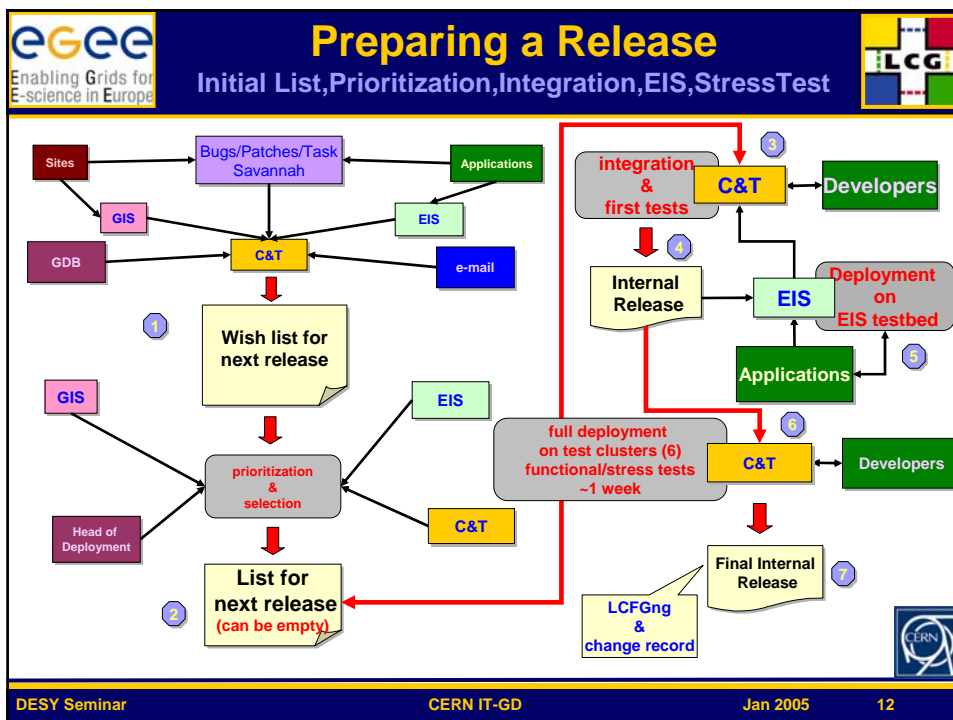

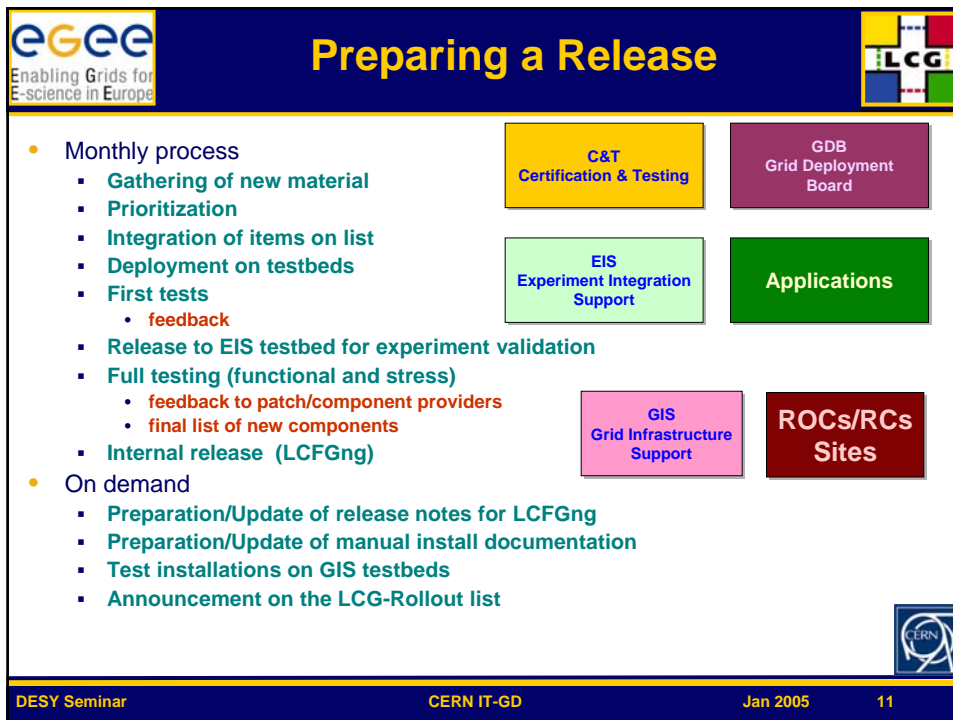

- sites are daily re-certified and pro ... ANNAH
- Experiments install their software and ... their IS
- **Adding new sites is now a quite sm**
- **Process fundamentally wrong:**
  - sites do not sign an agreement on "best practice"
- New process: <https://edms.cern.ch/document/1000000/1>

DESY Seminar
CERN IT-GD
Jan 2005
8

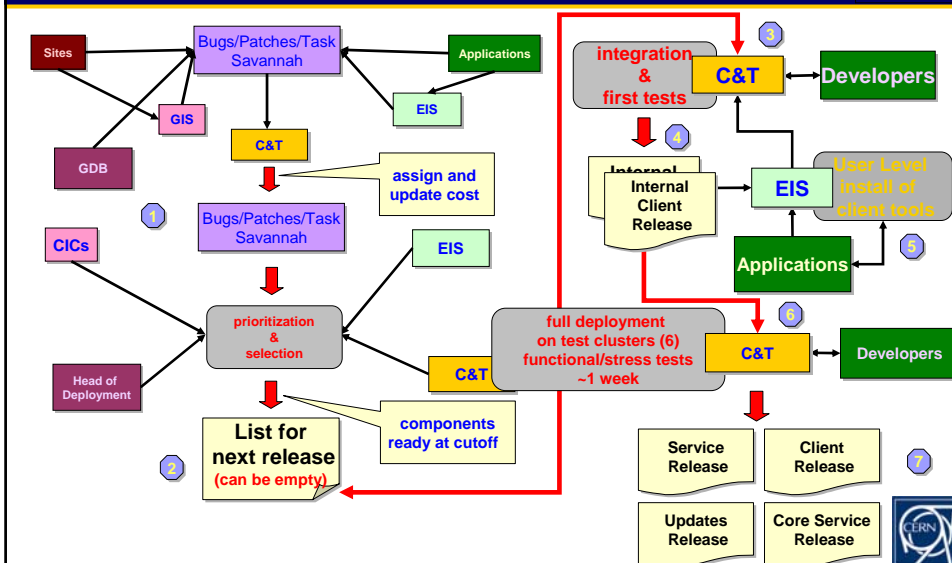

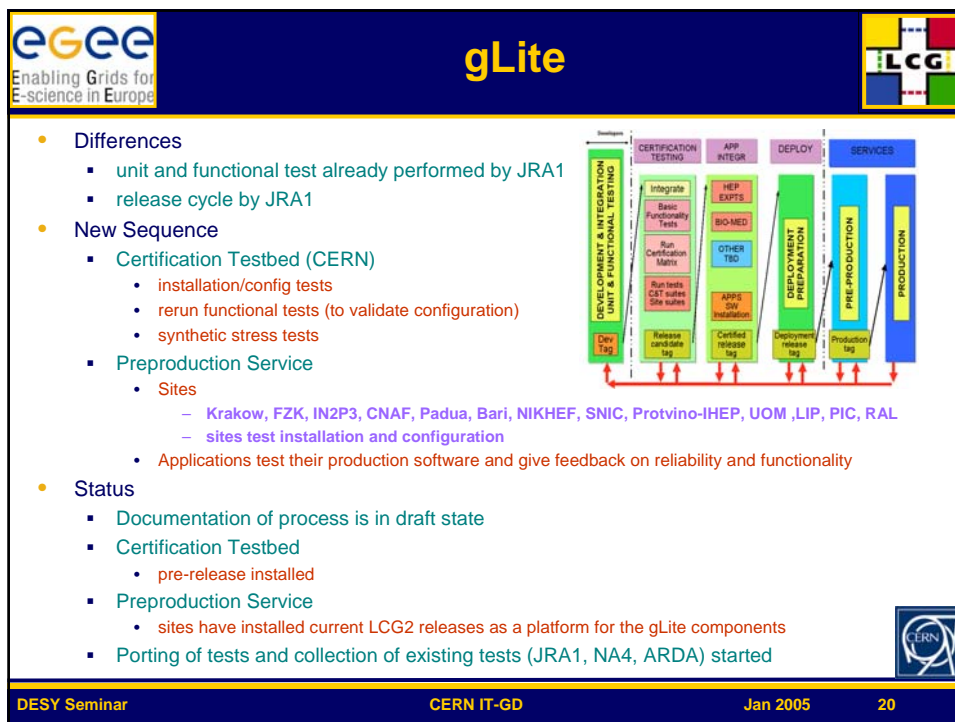

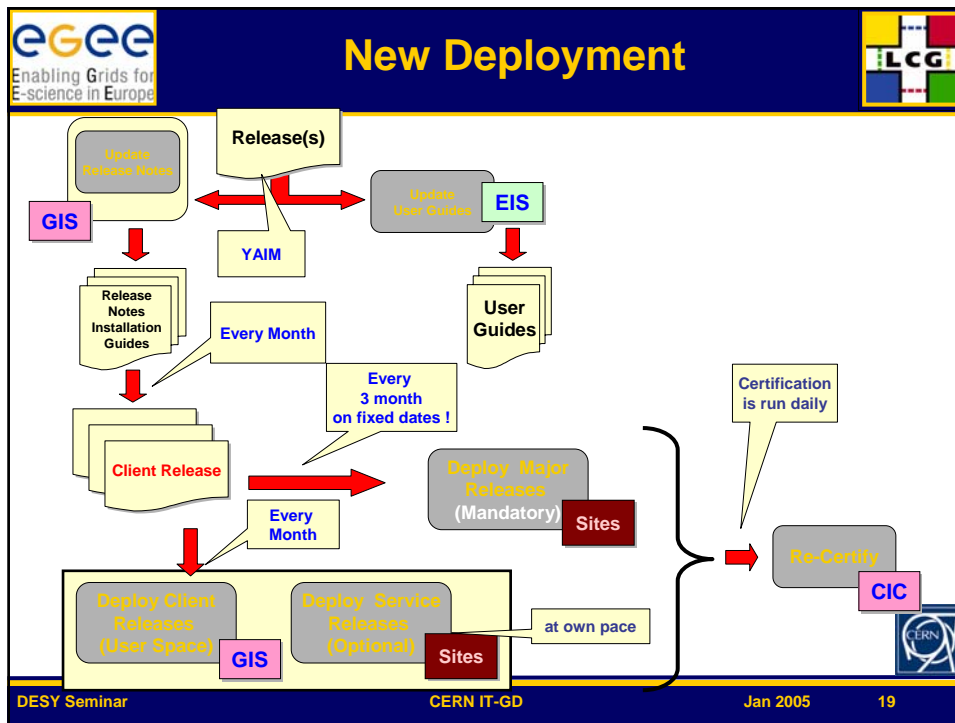

- 

- Data Challenges
  - client libs need fast and frequent updates
  - core services need fast patches (functional/fixes)
  - applications need a transparent release preparation
  - many problems only become visible during full scale production
- Installation tool not available for new OS versions
- Configuration a major problem on smaller sites
- Operations Workshop
  - T2 sites can handle major upgrades only every 3 month
  - sites need to give input in the selection of new packages
- gLite releases need to be deployed
  - software already partially tested by JRA1
    - certification will need fewer iterations
  - preproduction service
    - replaces part of the certification process

- Simple Installation/Configuration Scripts
  - YAIM (Yet Another Installation Method), semi automatic, simple configuration
    - all configuration for a site are kept in one file
  - APT (Debian) based installation of middleware RPMs
    - simple dependency management
    - updates (automatic or on demand)
  - Client libs packaged in addition as user space tar-ball
    - can be installed like application software
- Process (in development 2-4-0 is last release with old process)
  - new process to gather and prioritize new packages
    - formal
    - tracking tool with priorities assigned to the packages
    - cost to completion assigned (time of specific individual) at cut of day
    - selection process with participation of applications, sites and deployment
    - work will continue based on priority list between releases (rolling)

- different release types
  - client libs
  - services (CE, SE)
  - core services (RB, BDII,...)
  - major releases (configuration changes, RPMs, new services)
  - updates (bug fixes) added any time to specific releases
  - non critical components will be made available with reduced testing
- Fixed release dates for major releases (allows planning)
  - every 3 month, sites have to upgrade within 3 weeks
- Minor releases every month
  - based on ranked components available at a specific date in the month
  - not mandatory for T2s to follow
    - client libs will be installed as application level software
  - early access to pre-releases of new software for applications
    - client libs. will be made available on selected sites
    - services with functional changes will be installed on EIS testbed
    - early feedback from applications

## Summary of Release Process

- Certification of the middleware was the essential tool to improve its quality
- Early access to new releases was crucial for applications
- Process has to undergo evolutionary changes
  - software matures
    - certification becomes more complex (shift to applications)
  - scale (110 sites)
    - releases with radical changes become very hard to deploy
  - usage (production)
    - some uniformity and fast spread of fixes is expected by applications
- Preproduction Service for gLite
  - currently building up
    - new releases have to be introduced to subsets of the sites (staged)
  - feedback from applications essential to prioritize the work

## Impact of Data Challenges

- Large scale production effort of the LHC experiments
  - test and validate the computing models
  - produce needed simulated data
  - test experiments production frame works and software
- All experiments used LCG-2 for part of their production
  - test the provided grid middleware
  - test the services provided by LCG-2

Enabling Grids for  
E-science in Europe

## General Observations

- Real production is different from certification tests
  - Usage characteristics of real production can't be simulated
  - (Detailed) planning is of limited use
    - time better spend with small(er) scale pilot DCs
- Time matters
  - Delays in support and operation are deadly during DCs
  - Several iterations needed to get it right
  - Communication between sites, operations, and experiments matters
    - not all players handled DCs with same priority (communication problem)
- Middleware matures quickly during DCs
  - Scalability, robustness, functionality
  - Several of the experiments will do continues production from now on
- Probing concurrently multiple "dimensions" of the system can be confusing
  - Problems with different components mix
    - leads to confuse cause and effect
  - Dedicated "Service Challenges" will help to get a clear matrix

DESY Seminar  
DC summary

CERN IT-GD

23

Enabling Grids for  
E-science in Europe

## Problems during the data challenges

- All experiments encountered on LCG-2 similar problems
- LCG sites suffering from configuration and operational problems
  - not adequate resources on some sites (hardware, human..)
  - this is now the main source of failures
- Load balancing between different sites is problematic
  - jobs can be "attracted" to sites that have no adequate resources
  - modern batch systems are too complex and dynamic to summarize their behavior in a few values in the IS ----> Team working on evolution of the GLUE schema
- Identification and location of problems in LCG-2 is difficult
  - distributed environment, access to many logfiles needed.....
  - status of monitoring tools
- Handling thousands of jobs is time consuming and tedious
  - Support for bulk operation is not adequate
- Performance and scalability of services
  - storage (access and number of files)
  - job submission
  - information system
  - file catalogues
- Services suffered from hardware problems
  - (no fail over) -----> implemented workarounds for BDII and RBs

DESY Seminar  
DC summary

CERN IT-GD

Jan 2005

24

## Outstanding Middleware Issues

- Collection: Outstanding Middleware Issues
  - Important: 1<sup>st</sup> systematic confrontation of required functionalities with capabilities of the existing middleware
    - Some can be patched, worked around,
    - Those related to fundamental problems with underlying models and architectures have to be input as essential requirements to future developments (EGEE)
- Middleware is now not perfect but quite stable
  - Much has been improved during DC's
    - A lot of effort still going into improvements and fixes
    - Easy to deploy and operate storage management still an issue
      - especially for Tier 2 sites
      - effort to adapt dCache
      - effort in simple Disk Pool Manager
- Production with Geant4 in December
  - 86% success for complex application

## Operational issues (selection)

- Slow response from sites
  - Upgrades, response to problems, etc.
  - Problems reported daily – some problems last for weeks
- Lack of staff available to fix problems
  - Vacation period, other high priority tasks
- Various mis-configurations (see next slide)
- Lack of configuration management – problems that are fixed re-appear
- Lack of fabric management (mostly smaller sites)
  - scratch space, single nodes drain queues, incomplete upgrades, ....
- Lack of understanding
  - Admins reformat disks of SE ...
- Provided documentation often not (carefully) read
- new activity to simplify configuration and installation
  - simpler way to install middleware on farm nodes
  - opens ways to maintain middleware remotely in user space
- Firewall issues –
  - often less than optimal coordination between grid admins and firewall maintainers
- openPBS problems
  - Scalability, robustness (switching to torque helps)

## Site (mis) - configurations

- Site mis-configuration was responsible for **most** of the problems that occurred during the experiments Data Challenges. Here is a non-complete list of problems:

integrated all common small problems into

# ONE BIG PROBLEM

- – Default user shell environment too big
- 
- Only partly related to middleware complexity

## Operating Services for DCs

- Multiple instances of core services for each of the experiments
  - separates problems, avoids interference between experiments
  - improves availability
  - allows experiments to maintain individual configuration
  - addresses scalability to some degree
- Monitoring tools for services currently not adequate
  - tools under development to implement control system
- Access to storage via load balanced interfaces
  - CASTOR
  - dCache
- Services that carry “state” are problematic to restart on new nodes
  - needed after hardware problems, or security problems
  - For RBs processing and storage of state has been separated
- “State Transition” between partial usage and full usage of resources
  - required change in queue configuration (faire share, individual queues/VO)

## Support during the DCs

- User (Experiment) Support:
  - GD at CERN worked very close with the experiments production managers
  - Informal exchange (e-mail, meetings, phone)
    - "No Secrets" approach, GD people on experiments mail lists and vice versa
      - ensured fast response
    - tracking of problems tedious, but both sites have been patient
    - clear learning curve on **BOTH** sites
    - LCG GGUS (grid user support) at FZK became operational after start of the DCs
      - due to the importance of the DCs the experiments switch slowly to the new service
    - Very good end user documentation by GD-EIS
    - Dedicated testbed for experiments with next LCG-2 release
      - rapid feedback, influenced what made it into the next release

- Installation and site operations support:
  - GD prepared releases and supported sites (certification, re-certification)
  - Regional centres supported their local sites (some more, some less)
  - **Community style help via mailing list (high traffic!!)**
  - FAQ lists for trouble shooting and configuration issues: [Taipei RAL](#)

DESY Seminar
CERN IT-GD
Jan 2005
29

## Support during the DCs

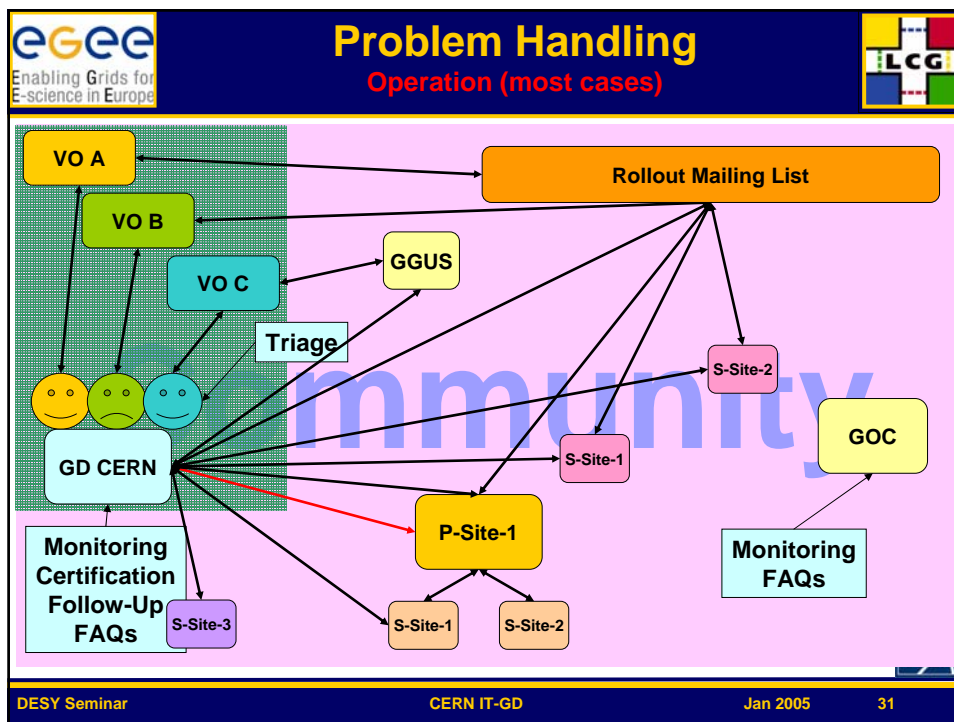

- Operations Service:
  - RAL (UK) is leading sub-project on developing operations services
  - Initial prototype <http://www.grid-support.ac.uk/GOC/>
    - Basic monitoring tools
    - Mail lists for problem resolution
    - Working on defining policies for operation, responsibilities (draft document)
    - Working on grid wide accounting
  - Monitoring:
    - GridICE (development of DataTag Nagios-based tools)
    - GridPP job submission monitoring
    - Information system monitoring and consistency check  
<http://goc.grid.sinica.edu.tw/gstat/>
  - CERN GD daily re-certification of [sites \(including history\)](#)
    - escalation procedure
    - tracing of site specific problems via problem tracking tool
    - tests core services and configuration

**eGEE**  
Enabling Grids for  
E-science in Europe

**LCG Workshop on Operational Issues**

**LCG**

- Motivation
  - LCG -> (LCG&EGEE) transition requires changes
  - Lessons learned need to be implemented
  - Many different activities need to be coordinated
- 02 - 04 November at CERN
  - >80 participants including from GRID3 and NorduGrid
  - Agenda: [Here](#)
  - 1.5 days of plenary sessions
    - describe status and stimulate discussion
  - 1 day parallel/joint working groups
    - very concrete work,
    - results into creation of task lists with names attached to items
  - 0.5 days of reports of the WG

**CERN**

DESYS Seminar CERN IT-GD Jan 2005 32

## LCG Workshop on Operational Issues

### WGs I

- Operational Security
  - Incident Handling Process
  - Variance in site support availability
  - Reporting Channels
  - Service Challenges
- Operational Support
  - Workflow for operations & security actions
  - What tools are needed to implement the model
  - "24X7" global support
    - sharing operational load (taking turns)
  - Communication
  - Problem Tracking System
  - Defining Responsibilities
    - problem follow-up
    - deployment of new releases
  - Interface to User Support

DESY Seminar
CERN IT-GD
Jan 2005
33

## LCG Workshop on Operational Issues

### WGs II

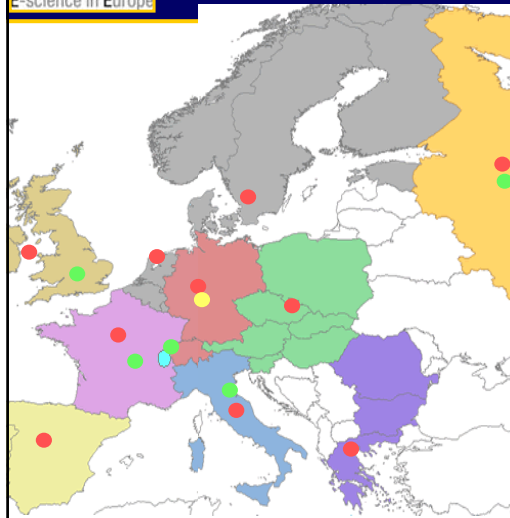

- Fabric Management
  - System installations
  - Batch/scheduling Systems
  - Fabric monitoring
  - Software installation
  - Representation of site status (load) in the Information System
- Software Management
  - Operations on and for VOs (add/remove/service discovery)
  - Fault tolerance, operations on running services (stop, upgrades, re-starts)
  - Link to developers
  - What level of intrusion can be tolerated on the WNs (farm nodes)
    - application (experiment) software installation
  - Removing/(re-adding) sites with (fixed) troubles
  - Multiple views in the information system (maintenance)

DESY Seminar
CERN IT-GD
Jan 2005

- A hand-drawn mind map titled "SUPPORT" on a chalkboard. The central node is "SUPPORT". It branches into several categories:
- Areas** (left):
    - Other projects
    - Needs
    - National office
    - Grants
  - Systems** (top-left):
    - VO
    - Software
    - Hardware
    - LG2
    - Gloss
    - SysAdmins
  - Users** (top):
    - VO
    - For
    - Libraries
    - Utility
    - Coordination
    - SUA
    - Links
    - Documentation
    - News
    - Partners
    - Groups
    - RACS
    - Sites
    - VO EXPERTS
    - Providers
    - Nicks
    - Microservices
    - CICS
    - NTP
    - VO Support
    - Tasks
    - Preparing Documentation
    - Templates
    - Examples
    - Times handling
  - GP** (bottom-right):
    - CICS
    - NTP
    - VO Support
    - Tasks
    - Preparing Documentation
    - Templates
    - Examples
    - Times handling
  - Tools** (bottom):
    - Desktop
    - Tracing Station
    - Regional Workshops
    - Sports Events
    - Grants
    - RSS
    - Feeling like
    - RSS

- **Very productive workshop**
- Partners (sites) assumed responsibility for tasks
- Discussions very much focused on **practical** matters
- Some problems ask for architectural changes
  - gLite has to address these
- It became clear that not all sites are created equal
- Removing troubled sites is inherently problematic
  - removing storage can have grid wide impact
- Key issues in all aspects is to define split between:
  - Local, Regional and Central control and responsibility
- All WGs discussed communication

## SA1 – Operations Structure

- Operations Management Centre (OMC):
  - At CERN – coordination etc
- Core Infrastructure Centres (CIC)
  - Manage daily grid operations – oversight, troubleshooting
  - Run essential infrastructure services
  - Provide 2<sup>nd</sup> level support to ROCs
  - UK/I, Fr, It, CERN, + Russia (M12)
  - Taipei also run a CIC
- Regional Operations Centres (ROC)
  - Act as front-line support for user and operations issues
  - Provide local knowledge and adaptations
  - One in each region – many distributed
- User Support Centre (GGUS)
  - In FZK – manage PTS – provide single point of contact (service desk)
  - Not foreseen as such in TA, but need is clear

## Grid Operations

- The *grid* is flat, but
- *Hierarchy* of responsibility
  - Essential to scale the operation
- CICs act as a single Operations Centre
  - Operational oversight (**grid operator**) responsibility
  - rotates weekly between CICs
  - Report problems to ROC/RC
  - ROC is *responsible* for ensuring problem is resolved
  - ROC oversees regional RCs
- ROCs responsible for organising the operations in a region
  - Coordinate deployment of middleware, etc
- CERN coordinates sites not associated with a ROC

- **CIC-on-duty**
  - Responsibility rotates through CIC's – one week at a time
  - Manage daily operations – oversee and ensure
    - Problems from all sources are tracked (entered into PTS)
    - Problems are followed up
    - CIC-on-duty hands over responsibility for problems
  - Hand-over in weekly operations meeting
- **Daily operations:**
  - Checklist
  - Various problem sources: monitors, maps, direct problem reports
- **Next step:**
  - Continue to develop tools to generate automated alarms and actions

The screenshot shows the CIC Web Portal interface. On the left is a sidebar with navigation links: Home, On Duty, On Duty Procedures, Accounting, Resources, Links, Publications, and Public Info. The main content area is titled 'Core Infrastructure Center (CIC) Portal' and contains a table for 'Weekly Operations Meetings'. The table has columns for 'Week', 'Date', 'Time', and 'Contact'. The right sidebar contains 'Latest news' and 'Information publishing requests'.

Enabling Grids for  
E-science in Europe

## Summary

- LCG-2 services have been supporting the data challenges
  - Many middleware problems have been found – many addressed
  - Middleware itself is reasonably stable (within the architecture)
- Biggest outstanding issues are related to providing and maintaining stable operations
- Future middleware has to take this into account:
  - Must be more manageable, trivial to configure and install
  - Management and monitoring must be built into services from the start on
- Operational Workshop has started many activities
- Operation moved to EGEE structure
- gLite and LCG2 will coexist for some time

## Sité? test report

WN: [kirin.physics@carleton.ca](mailto:kirin.physics@carleton.ca)

date: Sat Sep 25 03:54:55 EDT 2004

## Table of contents

- Configuration of the Worker Node

- ## Environment variables (bash)

- Difference between variables for b

- ### Software paths for the experiment

- Mountpoints on WN OK OK

- Replica Manager configuration

- | Installed RPMs list        | Architecture | Version |
|----------------------------|--------------|---------|
| Installed software version | n/a          | n/a     |

- |                            |        |        |    |
|----------------------------|--------|--------|----|
| Installed software version |        |        |    |
| ica Manager tests          | FAILED | FAILED | EA |

- Checking if we can see the SE at C

- Checking printInfo command

- Check copyFile command

- ### Checking replication to SE at CERN

- Checking 3rd party replication  
Checking copyFile for 3rd party re

- Checking deleteFile command on r

- ## Application Manager tests using LCG tools

- Checking information system (GFA)  
Checking if default SE is defined

- Checking lcg-cr command

- Check lcg-cp command

- Checking 1cg-rep to SE at CERN
- Checking 3rd party replication

- Checking lcg-cp for 3rd party repl

- ### Checking lcg-del command on rep

-
